

Amendments to the Specification:

The following paragraph should now read:

[0030] Referring to FIGS. 1, 2, 3 and 4, a multi-bladed cartridge 10, including two or more blades, is attached to a handle 11 and is assembled of a seat 12, a cap 14, a pair of seat 16 and cap 18 blades. The seat blade 16 having a leading cutting edge 28 and the cap blade 18 provided with a trailing cutting edge 30, which is spaced rearward from the leading cutting edge 28, are spaced apart and define space therebetween. As skin flows from a shave plane A-A (FIG. 4), which is tangent to the seat 12 and the cap 14, it tends to project over this plane and penetrate into the space between the seat blade 16 and cap blade 18. The portion of the skin protruding between the blades 16 and 18 may get nicked or cut. To minimize the extent of penetration, the multi-blade razor cartridge 10 has a guide unit 48 (FIGS. 2 and 4) for controlling skin flow, which guide unit is mounted between the blades 16 and 18 to at least partially fill the space between these blades. The cap 46 can include projections 26 (FIG. 4) that extend outwardly from, and that are spaced apart across the cap 46. The projections 26 are known in the art and, therefore, will not be discussed in greater detail herein.
